ABSTRACT

A system, a method, and a cellular communication terminal for accessing servers. The cellular communication terminal is arranged with a receiver and a transmitter, to receive and transmit data packets from at least

5   one server through links. The links are arranged to forward the data packets between the terminal and the server. The terminal is further arranged with a first memory comprising an identifier and at least one item. The item is provided with an access point, which indicates the location of the server to be accessed. The server is accessed by sending the access point and the

10   identifier to the link to identify the content to be accessed. A browser application is arranged in the terminal, to establish a session to at least a first link, by reading an item from the first memory. Also, the terminal has a user interface connected to the browser application. The user interface comprises display means for displaying content and user input means to control the

15   browser application.
